

ComicCraft – AI Comic Story Creator

Phase 1: Brainstorming & Ideation Phase

1. Introduction

ComicCraft is a web-based application designed to generate personalized comic book stories and illustrations using AI. The project accepts user-provided creative inputs and transforms them into a panel-by-panel comic experience.

2. Initial Project Idea

The main idea identified during brainstorming is to make comic creation easier for users who may not have professional writing or drawing skills. The application combines AI-generated storytelling with AI-generated illustrations.

3. Project Goal

The goal is to provide an end-to-end workflow from a simple story prompt to a complete comic that can be viewed online and exported as a PDF.

Phase 1 – Problem Identification

1. Existing Challenge

Creating a comic manually requires several separate activities: developing a story, writing dialogue, designing scenes, creating illustrations, arranging panels, and preparing a final document. This can be time-consuming for beginners.

2. Identified Need

The brainstorming process identified a need for a simple system that can connect these tasks into one workflow. Users should be able to describe their idea without needing to manually prepare every comic component.

3. Proposed Approach

ComicCraft addresses this idea by accepting story-related information and using AI models to produce structured comic content, narration, dialogues, illustrations, and a final PDF.

4. Target Experience

The intended experience is simple: enter the creative idea, generate the comic, review the panels, and download the finished comic.

Phase 1 – Feature Brainstorming

1. User Input Features

The planned input fields are Story Prompt, Main Character Name, Setting, Story Tone, and Art Style. These inputs allow the generated comic to be personalized.

2. Story Generation Features

The system is planned to generate a structured five-panel outline followed by detailed narration and character dialogue.

3. Illustration Features

Each comic panel is planned to receive an AI-generated illustration based on an image prompt. The project uses Stable Diffusion through the Hugging Face Diffusers library for this part.

4. Preview and Export

Users can view the generated comic panel-by-panel through the web interface and export the complete comic as a downloadable PDF.

Phase 1 – AI & Technical Ideas

1. AI Model Planning

The project documentation identifies Gemini Flash for fast, structured comic panel outlines and Gemini Pro for detailed narration and character dialogue.

2. Image Generation Planning

Stable Diffusion is selected for generating comic-style illustrations from image prompts.

3. Application Architecture

The planned architecture contains three primary components: Frontend using HTML, CSS and Jinja2; Backend using FastAPI; and AI Integration using Google Gemini APIs and Hugging Face Diffusers.

4. Development Direction

The brainstorming phase therefore leads toward a modular application in which user input is processed by the backend, AI services generate the content, and the frontend displays the result.

Phase 1 – Expected Outcome & Summary

1. Expected Output

The expected output of the idea is a complete personalized comic with multiple panels, illustrations, narration, and dialogue. The finished comic should also be available as a PDF.

2. Proposed User Flow

User enters story details → AI generates the comic outline → narration and dialogue are created → panel illustrations are generated → panels are organized → comic is previewed → PDF is exported.

3. Phase 1 Conclusion

Brainstorming and ideation establishes the purpose, problem, proposed solution, major features, AI components, and expected output of ComicCraft. These ideas form the foundation for the later development phases.
